Eris: the AI substitute that teaches your class, your way

The problem

When a teacher is away, the class is usually lost: a free period, or a substitute who doesn't know the subject. Students fall behind, and they can't ask anyone their doubts in their own language.

The solution

Eris is an AI substitute that teaches the teacher's own lesson, in their style.

- **For teachers:** upload slides, PDF notes or textbook pages, and describe how you teach. Eris writes the lesson; you preview, edit and approve it, then check attendance and the doubts students asked.
- **For students:** a voiced tutor teaches on four boards: the real slides (with a pen that circles the exact part of a diagram), a handwritten notebook with step-by-step sketches, a code editor that really runs programs, and interactive graphs.
- **Doubts at any moment:** hold Space and speak. The teacher stops mid-sentence, answers out loud on the board, then picks up from where it stopped.

Built on Gnani.ai

Eris speaks and listens in 10 Indian languages: English, Hindi, Tamil, Telugu, Kannada, Malayalam, Marathi, Bengali, Gujarati and Punjabi.

- **Timbre v2.5 (TTS)** voices every lesson and every answer, in a woman's or a man's voice to match the teacher.
- **Prisma (STT)** hears each spoken doubt in the lesson's language, in about 0.3 seconds, in any browser.

Why teachers can trust it

Nothing reaches a student unchecked. Every script passes code checks and Jev, a separate judging model that asks: does it explain clearly with a worked example, stay true to the teacher's material, and match the real program output? Failed checks go back to the writer before the teacher sees the script. Only an approved script reaches the class, and guardrails screen every doubt and every sentence of the answer.

How it's built

Eris writes each lesson in three checked steps (research, teaching, staging for the screen). Doubt answers stream sentence by sentence, so the teacher starts speaking while the rest is written. FastAPI and plain JavaScript, deployed with Docker and HTTPS on Azure.
